

The Student Who Knows Everything

Project Overview & Objectives — Team

KUET_Titanium

Forkathon: Freshers Hackathon 2026 (presented by ForkedArch, powered by XtendArena)

1. Problem Statement

Every campus has one person who seems to know everything — which teacher wants assignments handwritten, which room the lab moved to, where to find last year's question papers, or which office needs three signatures instead of two.

That person is usually a senior student. And every year, they graduate — taking years of hard-earned, practical knowledge with them. The next batch of students starts from zero, repeating the same confusion, asking the same questions, and making the same mistakes their seniors already solved.

-  **Scattered Information** — Knowledge lives nowhere official. It is fragmented across

temporary group chats, word of mouth, and individual memory.

-  **No Knowledge Retention** — When experienced seniors graduate, campus wisdom resets back to zero.
 -  **Trust & Validity Gap** — Information ages. A senior's tip from three years ago might be outdated today, and advice varies wildly in reliability depending on who gives it.
-

2. Our Solution

We are building an **offline-first Android app** that acts as a living, evolving memory for the campus community — a system where practical knowledge is captured once, verified by the community, and passed down to every new batch automatically.

3. Core Objectives

Offline-First Android App

- Works seamlessly without an internet connection (inside thick lab walls, underground rooms, or low-signal campus areas).

- Automatically syncs new contributions whenever connectivity is restored.

Flexible Knowledge Database

- Accommodates diverse data formats — locations, contacts, warnings, document requirements, and procedural steps.
- Built on a schema that handles flexible data types without forcing them into a rigid structure.

Searchable Knowledge Chunks

- Information is stored as bite-sized, self-contained, tagged entries rather than long, unstructured posts.
- Enables high-precision search to return exact answers instantly.

Guided Step-by-Step Roadmaps

- Complex processes (e.g., getting a form signed, applying for a re-exam, course registration) are laid out as clear, sequential steps: Step 1 → Step 2 → Step 3.

Data Validation & Lifespan

- Every entry tracks a freshness and validity status.
- Automatically flags aging entries and allows community re-verification so outdated information loses trust over time.

Contribution Scores & Levels

- Tracks contributor accuracy through community verification.
- Users earn trust scores and level tiers, ensuring high-integrity contributors carry more weight than unverified sources.

In short: We are building a trust-aware, self-updating memory for the campus — ensuring that when the senior who knows everything graduates, everything they knew stays behind.

4. How It Works

1.  **Capture** — Seniors and students submit knowledge entries (notes, lab reports, assignment tips, question papers via drive links, course suggestions, submission locations, event info, etc.) through a simple in-app submission form.
2.  **Organize** — Entries are stored in a flexible local database, tagged by category (academic, facilities, procedures, resources) so they're browsable and searchable instead of scattered across group chats and memory.
3.  **Verify** — Each entry carries a validity/lifespan marker. When the app has connectivity, it checks for updates and flags entries that may be

outdated; contributors and peers can confirm or correct entries.

4. 🔍 **Search & Guide** — Students use the search bar to find what they need instantly, or follow a guided, step-by-step roadmap for common problems.
 5. 🔄 **Pass it on** — Contribution earns levels/score, encouraging continuous participation so the knowledge base keeps growing after each graduating batch leaves.
-

🏗️ 5. Architecture

Add your architecture diagram here. Demo diagram below:

```
User
|
v
Frontend
|
v
Backend / API
|
|— Database
|
|— External Services
```

-  **User** — a student interacting with the app to search, submit, or browse knowledge.
-  **Frontend** — the offline-capable Android UI.
-  **Backend / API** — handles requests, validation logic, and contribution scoring.
-  **Database** — local/synced storage holding the knowledge base for offline access.
-  **External Services** — drive links for documents (lab reports, question papers) and online endpoints used for syncing or validating data when connectivity is available.

6. Limitations

Symbol	Limitation	Description
	Limited online database integration	Built around an offline, on-device data store by default — real-time sync with a central online database isn't the primary focus, so devices may temporarily hold different versions of the knowledge base until sync happens.

Symbol	Limitation	Description
	Validation depends on online connectivity	Checking whether an entry is still valid/current requires reaching an online source; offline, the app relies on the last-known status, which may become outdated.
	Knowledge quality depends on contributors	Entries come from students/seniors, not an official authority, so accuracy depends on who contributes and how carefully.
	No built-in conflict resolution	No defined process yet for automatically resolving conflicting edits made by different users while offline.
	Scope limited to CSE students initially	The database is designed around knowledge suitable for CSE students; other departments aren't covered in this version.

Symbol	Limitation	Description
	Search is keyword-based	Matches terms rather than understanding intent, so vaguely-worded queries may miss relevant results.
	Gamification is optional and unproven	The leaderboard is optional, so there's no guarantee it meaningfully drives continued contribution long-term.
	Dependent on external links for heavy content	Lab reports, assignments, and question papers are referenced via drive links, so this content is inaccessible offline.

7. Sample (Dummy) Data

-  **Notes** — lab reports, assignments, question papers (via drive link).
-  **Course suggestions** — recommended electives/resources.

- 📁 **Assignment & lab report submission** — where and how to submit, and to whom.
 - 💬 **Course suggestion sourcing** — from whom and how the suggestion was gathered.
 - 📍 **Location info** — where lab classes, course classes, or assignments take place.
-

🚀 8. Getting Started

```
# Clone the repository
git clone
https://github.com/<org>/<repo>.git
cd <repo>

# Install dependencies
# (fill in once the stack is finalized,
# e.g. ./gradlew build)

# Run the app
# (fill in run instructions)
```

👏 9. Contributing

Contributions are welcome! Please see [CONTRIBUTING.md](#) for guidelines on submitting issues, feature requests, and pull requests.

10. License

This project is licensed under the [MIT License](#).
