

The Student Who Knows Everything

Project Overview & Objectives — Team KUET_Titanium

1. Problem Statement

Every campus has one person who seems to know everything — which teacher wants assignments handwritten, which room the lab moved to, where to find last year's question papers, or which office needs three signatures instead of two.

That person is usually a senior student. And every year, they graduate — taking years of hard-earned, practical knowledge with them. The next batch of students starts from zero, repeating the same confusion, asking the same questions, and making the same mistakes their seniors already solved.

-  **Scattered Information:** Knowledge lives nowhere official. It is fragmented across temporary group chats, word of mouth, and individual memory.
-  **No Knowledge Retention:** When experienced seniors graduate, campus wisdom resets back to zero.
-  **Trust & Validity Gap:** Information ages. A senior's tip from three years ago might be outdated today, and advice varies wildly in reliability depending on who gives it.

2. Our Solution

We are building an offline-first Android app that acts as a living, evolving memory for the campus community — a system where practical knowledge is captured once, verified by the community, and passed down to every new batch automatically.

3. Core Objectives

Offline-First Android App

- Works seamlessly without an internet connection (inside thick lab walls, underground rooms, or low-signal campus areas).
- Automatically syncs new contributions whenever connectivity is restored.

Flexible Knowledge Database

- Accommodates diverse data formats — locations, contacts, warnings, document requirements, and procedural steps.
- Built on a schema that handles flexible data types without forcing them into a rigid structure.

Searchable Knowledge Chunks

- Information is stored as bite-sized, self-contained, tagged entries rather than long, unstructured posts.
- Enables high-precision search to return exact answers instantly.

Guided Step-by-Step Roadmaps

- Complex processes (e.g., getting a form signed, applying for a re-exam, course registration) are laid out as clear, sequential steps (Step 1 → Step 2 → Step 3).

Data Validation & Lifespan

- Every entry tracks a freshness and validity status.
- Automatically flags aging entries and allows community re-verification so outdated information loses trust over time.

Contribution Scores & Levels

- Tracks contributor accuracy through community verification.
- Users earn trust scores and level tiers, ensuring high-integrity contributors carry more weight than unverified sources.

 **In short:** We are building a trust-aware, self-updating memory for the campus — ensuring that when the senior who knows everything graduates, everything they knew stays behind.
